Introduction

On July 13, 2006, The Port Authority of New York and New Jersey (PANYNJ) issued Administrative Instruction 45-2 (AI 45-2) “to reduce adverse environmental impacts of the design, construction, operation and maintenance and occupancy or leasing of new or substantially renovated buildings and facilities, reconstruction projects, and programs”. AI 45-2 referenced creation of sustainable design guidelines and an accompanying compliance framework, which were incorporated into the *Sustainable Design Guidelines* (formerly the *Sustainable Design Project Manual*, August 2007). As part of a regular update process, the *Sustainable Design Guidelines* have been revised in an Authority wide collaboration with representatives from each Line Department, led by the Engineering Department. As part of this update, a new section, the Sustainable Infrastructure Guidelines, has been developed to complement the Sustainable Building Guidelines section.

Each project will be determined as a “Building” or “Infrastructure” project at the time of the Project Definition Statement development. The project types listed below will use the associated section of the *Sustainable Design Guidelines*. The Sustainable Building Guidelines are required for both Port Authority and tenant capital projects. The Sustainable Infrastructure Guidelines are required only for Port Authority capital projects and are not required for tenant capital projects.

Building Project Types

(Uses Sustainable Building Guidelines)

- Foundation
- Indoor Signage
- Mechanical/Electrical or Fire Suppression System Replacement/Upgrade
- Office Facility
- Parking Garage
- Roof
- Substation
- Storage Facility
- Terminal (Airport, Rail, Port, Bus, etc.)
- Toll Plaza
- Ventilation Building

Associated Building Scopes

- Building Demolition
- Electronics Systems
- Communication Systems
- Indoor Lighting
- Security Systems

Infrastructure Project Types

(Uses Sustainable Infrastructure Guidelines)

- Airfield New Construction/Reconstruction
- Airfield Rehabilitation
- Bridges New Construction
- Bridge and Tunnel Rehabilitation
- Intelligent Transportation Systems
- Marine Structures (Docks, Wharves, Bulkheads, etc.)
- Roadway New Construction/Reconstruction
- Roadway Pavement Rehabilitation
- Parking Lot New Construction and Rehabilitation
- Parking Lot Rehabilitation
- Port Site Work
- Utility New Construction
- Utility Rehabilitation
- Trackwork

Associated Infrastructure Scopes

- Exterior Lighting
- Landscaping
- Mechanical/Electrical/Fire Suppression Systems

The Sustainable Building Guidelines take into account the US Green Building Council’s LEED™ 2.1 Rating System, New York State Executive Order 111 and the New York State Green Building Tax Credit. The Port Authority does not require that new buildings be LEED™ certified. By adhering to the guidelines, however, new buildings could obtain certification.

Introduction

Policy requirements vary according to project type (i.e. new construction, substantial renovations, reconstruction projects) and project size. The policy requires the most extensive application of sustainable design in new building projects that are 20,000 gr. sq. ft. or more. At the other end of the spectrum, the policy exempts all building projects that are smaller than 5,000 gr. sq. ft.

A Categorization Checklist helps you determine the type and size of your project and identify the corresponding policy requirements. The manual also provides Sustainable Building Guideline checklists that provide a quick overview of all the strategies that apply to your project type and size.

Each strategy is then presented in detail along with its corresponding template. The templates indicate the actions and documentation that are required to demonstrate adherence with the guidelines. Tenants who undertake capital projects must submit the completed templates for review as part of their Tenant Alteration Application.

Below is a summary of how this manual guides policy compliance:

- Use the Categorization Checklist to determine project type, size and policy requirements.
- Turn to the Sustainable Building Guidelines checklist for an overview of the guidelines that apply to your project type and size.
- Prepare a project description.
- Submit a completed template, as part of the Tenant Alteration Application, for each of the guidelines you incorporate in your project (tenants only).

The field of sustainable design is evolving quickly, and the Port Authority will seek to reflect this evolution by updating the guidelines as necessary and by seeking ways to facilitate policy compliance.

Policy for Sustainable Design AP45-2

Checklist for New Construction

PROJECT TYPE	New Building, Facility, or Multi-Building Construction	Based on Gross SF	YES / NO
1	<p>Is the New Building, Facility or Multi-Building Construction</p> <p>If YES, then adhere to the “Sustainable Building Guidelines” and surpass building code standards for energy efficiency by at least 20%. Indicate compliance with the Policy by providing the corresponding documentation in the "Guidelines" as part of the Tenant Alteration Application.</p> <p>If NO, go to step 2.</p>	> 20,000 SF	YES / NO
2	<p>Is the New Building, Facility or Multi-Building Construction</p> <p>If YES, then incorporate significant attributes of sustainable design (site planning, water, energy, materials and resources and indoor environmental quality) to comply with the Policy. To incorporate significant attributes of sustainable design, choose from and apply those sustainable design guidelines that are applicable to the project. Indicate compliance with the Policy by providing the corresponding documentation outlined in the "Guidelines" as part of the Tenant Alteration Application.</p> <p>If NO, go to step 3.</p>	5,000 – 19,999 SF	YES / NO
3	<p>Is the New Building, Facility or Multi-Building Construction</p> <p>If YES, project is exempt from this policy.</p>	< 5,000 SF	YES / NO

Checklist for Substantial Renovation & Reconstruction Projects

PROJECT TYPE	Substantial Renovation & Reconstruction Projects	Based on Gross SF	YES / NO
4	<p>Is the substantial renovation or reconstruction project in a building or facility that is</p> <p>If YES, then apply best efforts to adhere to the "Sustainable Building Guidelines" and surpass building code standards for energy efficiency by at least 10%. Indicate best efforts to adhere to the "Guidelines" by following those guidelines that are applicable to the project. Provide the corresponding documentation outlined in the "Guidelines" as part of the Tenant Alteration Application.</p> <p>If NO, go to step 5.</p>	>20,000 SF	YES / NO
5	<p>Is the substantial renovation reconstruction project in a building or facility that is</p> <p>If YES, then incorporate significant attributes of sustainable design (site planning, water, energy, materials and resources, and indoor environmental quality) to comply with the Policy. To incorporate significant attributes of sustainable design, choose from and apply those Sustainable Design Guidelines that are applicable to the project. Indicate compliance with the Policy by providing the corresponding documentation outlined in the "Guidelines" as part of the Tenant Alteration Application.</p> <p>If NO, go to step 6.</p>	5,000 – 19,999 SF	YES / NO
6	<p>Is the substantial renovation or reconstruction project in a building or facility that is</p> <p>If YES, project is exempt from this policy.</p>	< 5,000 SF	YES / NO

Checklist Definitions

Building or Facility is defined as a structure of 5,000 gross square feet or more.

Substantial Renovation is defined as the replacement of more than 50% of any building subsystem, measured in units appropriate to the subsystem within any consecutive 12-month period. (See checklist to determine if the project qualifies).

Subsystem is defined as a building assembly or building set of units made up of, but not limited to, exterior walls, windows, doors, roofs, ceilings, floors, lighting, piping, duct work, insulation, heating, ventilation and air cooling (HVAC) system equipment or components, electrical appliances and plumbing appliances.

Reconstruction Project or Gut Rehabilitation is defined as a renovation: (1) in which four or more Primary Building Systems of a building or facility undergo at least a 50% replacement within a 12-month period; and (2) during the performance of which the affected building area is unoccupied for 30 days or more due to the nature of the construction. (See checklist to determine if the project qualifies).

Primary Building System is defined as: (1) HVAC; (2) Lighting; (3) Exterior Walls and Windows; (4) Roofs and Ceilings; (5) Plumbing; (6) Other Electrical

Consultant/Applicant Name:

Intent: To avoid development of inappropriate sites.

Action: Avoid development in all sites, which meet any one of the following criteria:

- Less than 5 feet above the FEMA defined 100-year flood plain.
- Provide habitat for threatened or endangered species, public parkland.
- Within 100 feet of any water or wetlands in New Jersey or within 150 feet of any water or wetlands in New York.

For definitions of wetland and threatened or endangered species refer to US Army Corps of Engineers (USACE) and New Jersey Department of Environmental Protection (NJDEP)/New York State Department of Environmental Conservation (NYSDEC) regulations.

Submittals

Provide a Location Plan indicating secure bicycle racks and/or bicycle storage and changing/shower facilities in building for building users.

Provide documentation and calculations indicating percentage of building users using bicycle transportation on a daily basis.

Applicant

Signature

Company

Date

Role in Project

Intent: To minimize pollution and conserve energy by promoting use of low polluting, non-gasoline and hybrid fuel based vehicles.

Action: Create preferred parking areas for Alternative Fuel Vehicles (AFV's) and hybrid vehicles and consider provision of alternative fuel refueling stations when applicable. An AFV is defined as a vehicle, which utilizes electricity, hydrogen, propane, compressed natural gas, liquid natural gas, methanol or ethanol.

Project Title

TAA/PID Number

Phase

Stage I

Stage II

Stage III

Stage IV

Intent

- Minimize pollution and conserve energy by promoting use of low-polluting, non-gasoline and hybrid fuel based vehicles.

Referenced Standards

1. LEED™ 2.1 Sustainable Sites Credit 4.3 Alternative Transportation – Alternative Fuel Vehicles

Submittals

- Provide site drawings or parking plan highlighting preferred parking for alternative fuel vehicles and alternative-fuel refueling stations.
- Provide calculations indicating percentage of building occupants that utilize preferred parking and alternative-fuel refueling stations

Applicant

Company

Date

Role in Project

Intent: To conserve existing natural areas and restore damaged areas to provide habitat and promote biodiversity through reduced site disturbances.

Action: **LEED™ SS 5.1:** *On previously developed sites restore a minimum of 50% of the site area by replacing impervious surfaces with native or adaptive vegetation. On Greenfield sites, limit site disturbance including earthwork and clearing of vegetation to 40 feet beyond the building perimeter, 5 feet beyond primary roadway curbs, walkways and main utility trenches, and 25 feet beyond constructed areas with permeable surfaces that require additional staging areas in order to limit compaction in the constructed area.*

Project Title

TAA/PID Number

Phase

Stage I

Stage II

Stage III

Stage IV

Intent

- Conserve existing natural areas and restore damaged areas to provide habitat and promote biodiversity through reduced site disturbance.

Referenced Standards

1. LEED™2.1 Sustainable Sites Credit 5.1 Reduced Site Disturbance – Protect or Restore Open Space

Submittals

- For greenfield sites: provide documentation “demonstrating and declaring” that site disturbance, including earthwork and clearing of vegetation, does not exceed:
- 40 feet beyond the building perimeter,
 - 5 feet beyond primary roadway curbs, walkways and main utility trenches,
 - and 25 feet beyond constructed areas with permeable surfaces that require additional staging areas in order to limit compaction in the constructed area with permeable surfaces.

- Provide site drawings and specifications highlighting limits of construction disturbance.

OR

- For previously developed sites: provide documentation “demonstrating and declaring” restoration of degraded habitat areas.
- Include highlighted site drawing with area calculations demonstrating that 50% of the site area that does not fall within the building footprint has been restored.

Role in Project

Intent: To conserve and optimize building energy use.

Action: Prepare an Energy Management Plan to maximize the utilization of all site generated energy resources and to minimize off-site, non-sustainable generated energy resources. The Plan shall include an energy use budget for the project for the first year of full occupancy, broken down by major energy consumption category (i.e., heating, cooling, lighting, fan energy, pump energy, etc.). After each year of operation, the actual utilization of energy shall be recorded and compared to the original energy use budget. Significant deviations shall be evaluated and a detailed explanation for the probable cause of the deviation recorded in the updated plan. Strategies for reducing energy consumption below the first year of occupancy shall be identified and described.

The Energy Management Plan shall include a similar itemization of all site generated energy resources, including a budget for each component, and annual updates of actual performance. The Plan shall identify measures and strategies for increasing on-site utilization of energy above the first year of full occupancy performance.

The Energy Management Plan is an important tool in meeting the goals and reporting requirements of EO-111.

Intentionally Left Blank

Project Title

TAA/PID Number

Phase

Stage I

Stage II

Stage III

Stage IV

Intent

Conserve and optimize building energy use.

Referenced Standards

There is no standard referenced for this credit.

Submittals

Prepare and provide an Energy Management Plan that includes Pre-construction and Post-construction initiatives

Pre-Construction Initiatives:

- Maximum utilization of all site generated resources.
- Minimum utilization of off-site, non-sustainable generated energy resources.
- Energy use budget for the project for the first year of full occupancy, broken down by major energy consumption category (i.e., heating, cooling, lighting, fan energy, pump energy, etc.)
- Identification of measures and strategies for increasing on-site utilization of energy above the first year of full occupancy performance.

Post-Construction Initiatives:

- A record and comparison of actual energy utilization after first year of operation vs. original energy use budget.
- Evaluation of significant deviations and a detailed explanation.
- Identification and description of strategic energy consumption below the first year of occupancy.
- Itemization of all site generated energy resources, including a budget for each component, and annual updates of actual performance.

Form continued on other side.

Role in Project

Intent: To implement a Building Commissioning Plan.

Action: Implement fundamental, building systems commissioning through the use of a commissioning team consisting of Engineering Department and Facility staff not involved with the project. This team will prepare a commissioning plan and perform reviews for: design intent and design criteria, commissioning requirements in the contract documents, submittal review, verification of system performance, training, documentation, and post occupancy adherence to the established plan.

Upon completion of each stage of the project a report shall be prepared and submitted by the commissioning team documenting the results and certifying that the commissioning plan has been successfully executed.

The Commissioning Plan will be drafted by the commissioning team with input from all Engineering Department Divisions and in conjunction with Facility management, operations and maintenance staff. Reviews will be performed by the appropriate Engineering Division parties in accordance with the commissioning plan and current Quality Control Procedures as follows:

Phase	Commissioning Task	Commissioning Team					
		E/A Design Division	PMD Contract Division	Const. Division	Materials Division	Q/A Division	Maintenance/Operations
Stage I/II/III Design	Design Intent	X	X				
	Design Criteria	X	X	X	X	X	X

Date

Role in Project

Intent: To optimize the performance of building energy systems.

Action: Optimize the performance of building energy systems through the utilization of a full DOE-2.1E (or equivalent) building energy model to compare and evaluate alternative strategies for energy efficiency (kwh) and peak load reduction (kW). Integrate with Energy Management Plan. This is to include the full analysis of architectural and mechanical decisions in relationship to building energy expenditures. Achieve a minimum of 30% decrease in energy cost above ASHRAE 90.1/1999 (The use of a central chilling plant may require an adjustment for this goal. An adjustment must recognize that a decrease in overall savings will require the addition of comparable LEED™ points in other areas).

Provide daylight dimming and occupancy sensors on light fixtures where appropriate (i.e. in public areas). All light fixtures to use high efficiency electronic ballasts and low mercury/low lead, long life lamps. Specify recyclable lamps to extent practicable. Utilize energy efficient equipment, which meets or exceeds the following; NEMA premium efficiency motors, variable speed systems for all fans, pumps and motors and ENERGY STAR® products. Comply with FEMP levels for commercial products not rated by ENERGY STAR®. Provide a high performance building envelope, including minimized thermal bridging, superior insulation, air infiltration barrier and insulated wavelength selective glazing (i.e.: Low-E). Use airside and waterside economizers, as appropriate.

Company

Date

Role in Project

Intent: To provide for ongoing verification of optimal operation and energy utilization of building energy systems.

Action: Provide a computerized Building Management System (BMS) with continuous measurement capabilities for all controlled components. Provide means of monitoring water consumption for indoor domestic water and outdoor irrigation systems. Establish baseline performance benchmarks for each measured system in accordance with original building energy simulation and the Building Commissioning Plan. Develop and implement a maintenance program with ongoing measurement and verification of performance benchmarks via permanent monitoring systems configured consistent with original building energy simulation subsystems. Integrate performance benchmarks and maintenance programs into the Building Commissioning Plan.

Role in Project

Intent: To reduce pollution, noise and vibration from construction activities and vehicles.

Action: Implement a Construction Environment Plan, which reduces pollution, noise and vibration from construction activities and vehicles to adjoining neighborhoods.

- Develop a materials staging and construction access plan prior to start of construction. Truck staging zones are to be placed for minimum disruption and impact. Limit unnecessary idling times on diesel powered engines to 3 minutes. Consider bio-diesel fuel as an alternative to pure diesel.
- Non-road construction equipment to include diesel retrofit technology where practicable according to EPA diesel retrofit recommendations. Non-road diesel equipment of 60hp or greater to utilize ultra low sulfur diesel fuel (limit sulfur levels to 15ppm).
- Consider implementation of proposed EPA Tier 4 emission standards for non-road diesel equipment. Locate fixed diesel powered exhausts away from fresh air intakes.
- Reduce noise and vibration impacts through scheduling and coordination with adjacent construction activities. Consider noise barriers where practicable.
- Consider condition of surrounding buildings, structures, infrastructure and utilities where appropriate. Coordinate construction activities in adjacent and nearby locations to avoid or minimize impacts.

Project Title

TAA/PID Number

Company

Date

Role in Project

Intent: Design ambient noise levels for building users to appropriate levels to support human well-being and productivity.

Action: Minimize vibration and noise levels in indoor spaces and at exterior environments to achieve appropriate physical comfort and sound isolation for tasks and speech intelligibility.

- Program locations of mechanical equipment and other sources of noise away from areas of building and exterior spaces designed for use by building tenants and the public as practical.
- Design separations to minimize transfer of noise. Design interior separations in regularly occupied office areas to reflect a Sound Transmission Class (STC) level of 50 or better.
- Consider strategies to reduce the transmission of exterior ambient noise.

Project Title

TAA/PID Number

Phase

Stage I

Stage II

Stage III

Stage IV

Intent

- Design ambient noise levels for building users to appropriate levels to support human well-being and productivity.

Referenced Standards

There is no standard referenced for this credit.

Submittals

- Provide drawings and documentation declaring that the credit has been met.
- Separation of mechanical equipment rooms from areas used by occupants and the public.
 - Design separations to minimize transfer of noise. Indicate STC levels of 50 or better.
 - Reduce transmission of exterior noise.

Applicant

Signature

Company

Date

Role in Project

Intent: Optimize building lighting design to maximize comfort and productivity of building occupants and the efficiency of electric lighting.

Action: Design lighting systems to accommodate the following strategies.

- Coordinate ambient electrical lighting system with daylighting strategies to provide flexible illumination and maximize lighting energy contribution from daylight. Supplement ambient lighting system with multi-level task lighting to maintain a minimum of 35-foot candles (in typical office area) at desk level throughout hours of occupancy.
- Meet the recommendations of the Illuminating Engineering Society of North America's (IESNA) 9th Edition Handbook, Chapter 10 Quality of the Visual Environment, and the Lighting Design Guide.
- Provide high frequency electronic ballasts and low mercury/low lead lamps as defined by the US Environmental Protection Agency's Toxicity Characteristic Leaching Procedure (TCLP) testing procedure.
- Specify recyclable lamps.

Project Title

TAA/PID Number

Phase

Stage I

Stage II

Stage III

Stage IV

Intent

- Optimize building lighting design to maximize comfort and productivity of building occupants and the efficiency of electric lighting.

Referenced Standards

Sustainable Design Guidelines

Appendix

**Appendix A
Appendix B
Appendix C
Appendix D**

Appendix A

THE PORT AUTHORITY OF NY & NJ

AP 45-2

Office of the Executive Director

Effective: July 13, 2006

SUSTAINABLE DESIGN

I. Introduction

Sustainable design seeks to reduce the environmental impact to improve the maintenance and operation of new and renovated buildings and facilities. The Port Authority's sustainable design guidelines, developed and updated periodically by the Engineering Department, emphasize and strive for a balance among the following goals: (1) energy conservation and efficiency; (2) conservation of water and other natural resources; (3) waste reduction; and (4) healthy indoor environments. The guidelines also seek to benefit the region's economy by encouraging the use of locally manufactured materials and by supporting emerging regional markets in renewable energy and clean technologies.

II. Policy

A. The Port Authority's policy is to reduce adverse environmental impacts of the design, construction, operation and maintenance and occupancy or leasing of new or substantially renovated buildings and facilities, reconstruction projects, and programs. Departments adhere to this policy as outlined in paragraphs B, C, and D below. Because the policy may necessitate design decisions or the use of materials that have a higher first cost than would conventional designs or materials, departments implement sustainable design only when life cycle cost analyses, prepared by or reviewed by the Engineering Department, show that such costs are neutral, or that sustainable design will yield a positive return on investment (referred to as the "life cycle cost criterion").

B. New Buildings and Facilities

1. The sustainable design guidelines apply to a new building or facility that is 20,000 gross square feet or more, or any new multi-building construction project in which the buildings are of the same construction type and have a combined area of 20,000 gross square feet or more, provided the sustainable design measures meet the life cycle cost criterion and do not compromise safety or security. A new building or facility that is 20,000 gross square feet or more, or any new multi-building construction project in which the buildings are of the same construction type and have a combined area of 20,000 gross square feet or more, is to surpass building code standards for energy efficiency by at least 20 percent.

Appendix A

2. A new building or facility or multi-building project of less than 20,000 gross square feet incorporates significant attributes of applicable sustainable design principles (site planning, water, energy, materials and resources, and indoor environmental quality) to comply with this policy. Incorporation of these attributes is based on the life cycle cost criterion.

C. Substantial Renovations and Reconstruction Projects

1. A substantial renovation in a building or facility of 20,000 gross square feet or more is to surpass building code standards for energy efficiency by at least 10 percent, provided that this measure meets the life cycle cost criterion. Additionally, best efforts are used to adhere to the sustainable design guidelines.
2. A reconstruction project in a building or facility of 20,000 gross square feet or more is to surpass building code standards for energy efficiency by at least 10 percent, provided that this measure meets the life cycle cost criterion. Additionally, best efforts are used to adhere to the sustainable design guidelines.
3. A substantial renovation or reconstruction project in a building or facility of less than 20,000 gross square feet is to incorporate significant attributes of applicable sustainable design (with respect to water, energy, materials, resources and indoor environmental quality) to comply with this policy. Incorporation of these attributes is based on the life cycle cost criterion.

D. Programs

To the extent that it is deemed reasonable by the Chief of Real Estate and Development, with the concurrence of the Chief Financial Officer, applicable sustainable design principles (site planning, water, energy, materials and resources, and indoor environmental quality) are to be applied to all programs in which the Port Authority participates.

III. Definitions

- A. “Building” or “facility” is defined as a structure of 5,000 gross square feet or more.
- B. “Substantial renovation” is defined as the replacement of more than 50 percent of any building subsystem, measured in units appropriate to the subsystem, within any consecutive 12-month period.
- C. “Subsystem” is defined as a building assembly or building set of units made up of various components that serve a specific function including, but not limited to, exterior walls, windows, doors, roofs, ceilings, floors, lighting, piping, duct work, insulation, heating, ventilation and air cooling (HVAC) system

Appendix A

equipment or components, electrical appliances and plumbing appliances.

- D. “Reconstruction project,” commonly referred to as a “gut rehabilitation,” is defined as a renovation: (1) in which four or more primary building systems of a building or facility undergo at least a 50% replacement within a 12-month period; and (2) during the performance of which the affected building area is unoccupiable for 30 days or more due to the nature of the construction.
- E. “Primary building systems” is defined as: (1) HVAC; (2) lighting; (3) exterior walls and windows; (4) roofs and ceilings; (5) plumbing; and (6) other electrical.
- F. “Program” is defined as an action or series of related actions initiated by the Real Estate and Development Department that has been authorized by the Board of Commissioners.

IV. Space Leased to the Port Authority

To the maximum extent practical, the Real Estate Department implements the Port Authority’s sustainable design policy (with regard to water, energy, materials and resources, and indoor environmental quality) in spaces leased to the Port Authority. The Real Estate Department seeks to execute improvements whose expected cost savings provide a payback prior to the end of the lease term.

V. Port Authority Tenants

Leases provide or will provide that tenant construction, substantial renovation and reconstruction are to comply with this Administrative Policy statement. This requirement is incorporated into leases at inception, renewal or modification as appropriate.

VI. Roles & Responsibilities

A. Port Authority Contracts

The Project Management Department identifies building and facility projects in the Port Authority Capital Plan that meet the criteria for implementation of the sustainable design guidelines as set forth in paragraphs II. A. and II. B. For such projects, a project team comprising representatives from the Project Management Department, the Engineering Department, and the respective line department identifies and evaluates ways to comply with this policy. This evaluation takes place in the planning stages of design (pre-Stage I, Stage I, and Stage II). The Project Management Department reports the status of these projects to the Office of Environmental Policy, Programs & Compliance on a quarterly basis.

Appendix A

The Project Management Department develops and maintains an agency-wide list of proposed projects in the planning stages (pre-Stage I, Stage I, and Stage II) with opportunities for sustainable design applications. The Project Management Department also maintains a list of all projects that move into final design and construction (Stage III and IV) that incorporate sustainable design applications. The Project Management Department updates both lists at least twice a year and transmits them to the Office of Environmental Policy, Programs & Compliance.

B. Tenant Alteration Applications

The Tenant Alteration Application process requires tenants to adhere to this Administrative Policy statement. All tenant projects that require approval of Tenant Alteration Applications are reported to the Office of Environmental Policy, Programs & Compliance on a bi-annual basis.

C. Port Authority Programs

The Office of the Chief of Real Estate and Development periodically reports on its efforts to incorporate sustainable design principles in Port Authority programs to the Office of Environmental Policy, Programs & Compliance.

Appendix D Definitions

albedo – solar reflectance, ratio of reflected solar energy to incoming solar energy over wavelengths of 0.3-2.5 micrometers.

brownfield – former industrial land which has been polluted and abandoned.

development footprint – area of project site impacted by development, this includes roadways, parking areas, support structures, hardscape and walkways.

emmissivity (thermal) – ability of a material to shed infrared radiation (generally in the range of 3-40 micrometers) expressed as a number between 0 and 1 with 1 equivalent to 100% reradiation.

greenfield – undeveloped land.

heat Island – phenomenon of urban landscapes to create microclimates which are significantly warmer than regional patterns. The microclimate results from a combination of factors including waste heat from buildings and vehicles, reduced evaporative cooling and the trapping of solar insolation.

post-consumer recycled content – material component which was once a consumer waste product and is now incorporated into a new material.

post-industrial recycled content – material component which was once an industrial waste product and is now incorporated into a new material.

potable water – water that is suitable for drinking.

renewable energy – energy which has been captured from the sun, wind or biomass.
